

Emerging Properties in Self-Supervised Vision Transformers

Facebook AI Research

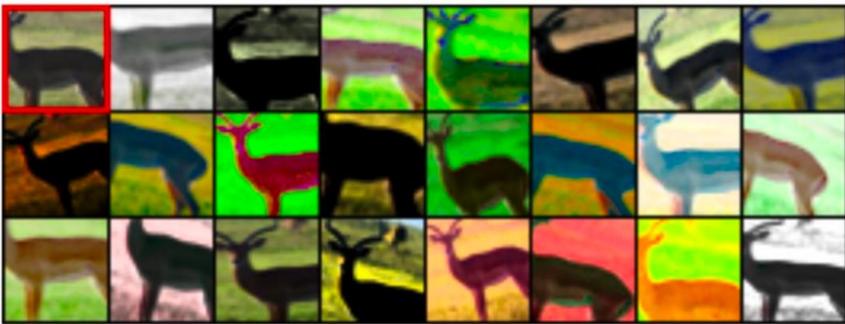

韩坤洋

Self-supervised pretraining

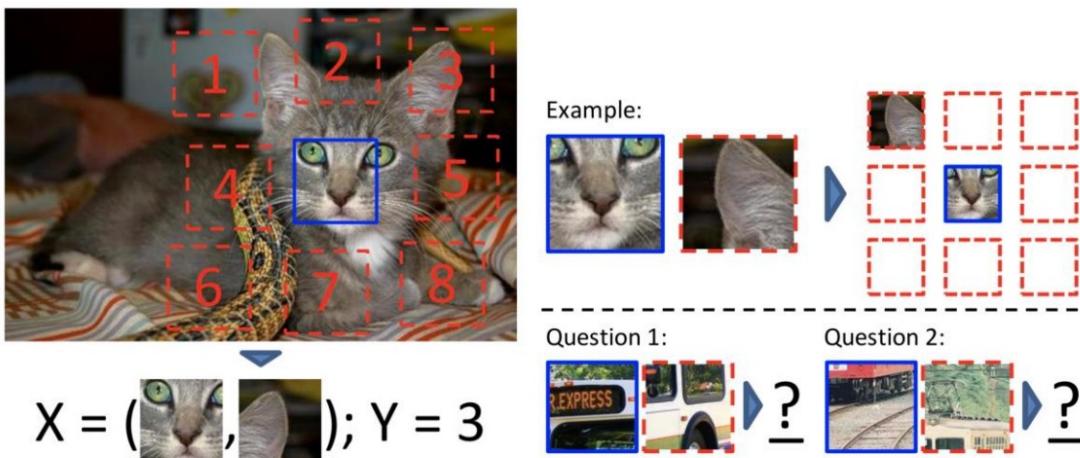

- Segmentation supervised
 - Image -> Logits mask prediction -> CELoss <- GT mask (Human annotate)
 - Image (-> Semantic information) -> Logits mask prediction
- Segmentation self-supervised
 - Image (-> Semantic info) -> Pretext pred -> Loss <- Pretext GT (Generated)
 - Image (-> Semantic info) -> Logits mask prediction -> CELoss <- GT mask

Self-Supervised Pretext

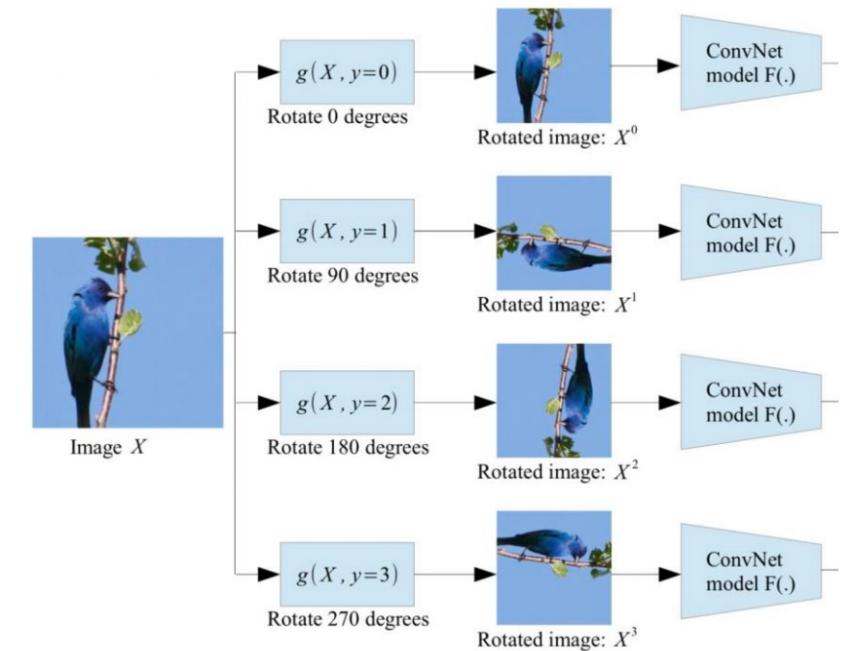

- Distortion

- Patches

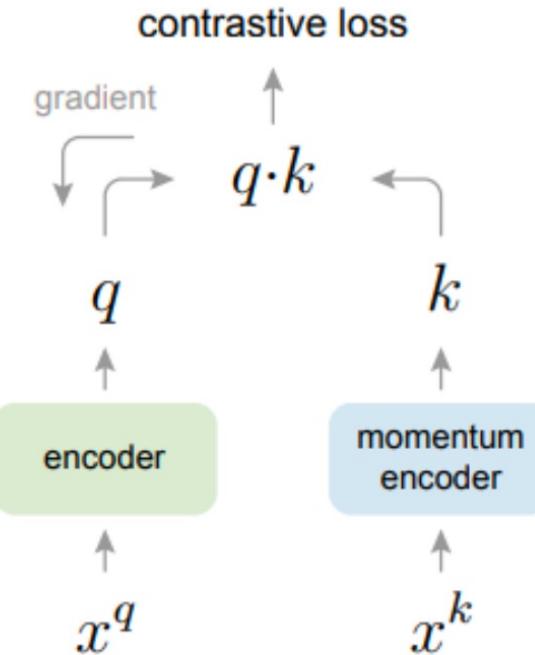

- Rotation

MoCo - Dictionary Look-up

- Keys in the dictionaries
 - Sample from data, images or patches
 - Represented by encoder network
- Encoded ‘query’
 - Similar to its matching ‘key’
 - Dissimilar to others
- Loss

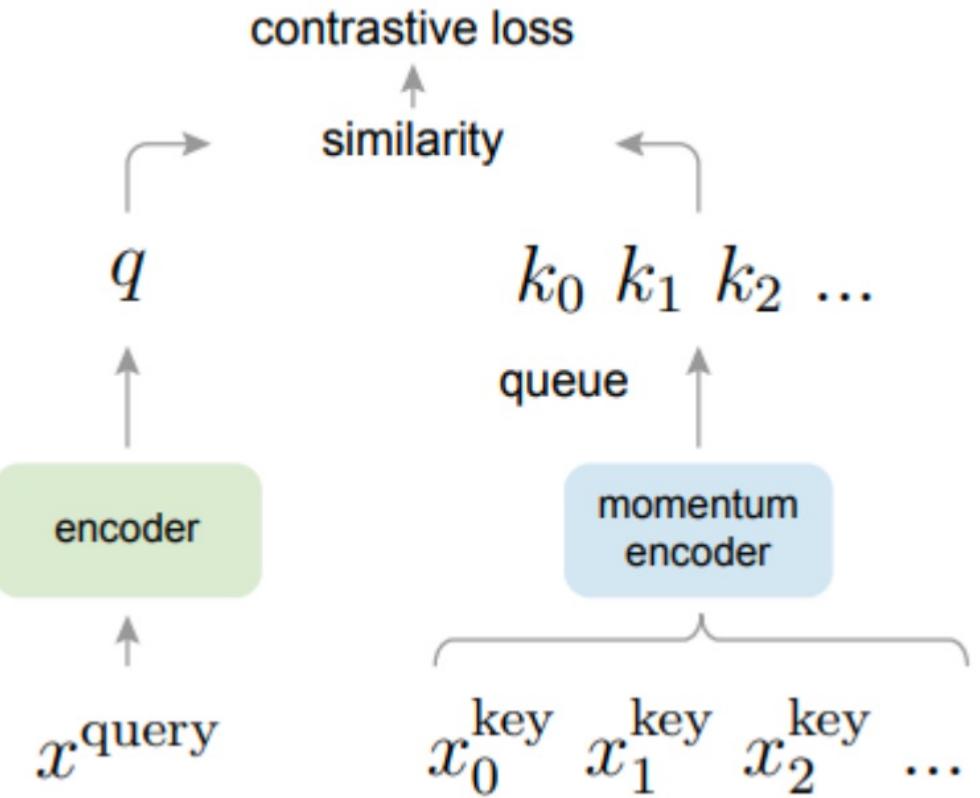

$$\mathcal{L}_q = -\log \frac{\exp(q \cdot k_+ / \tau)}{\sum_{i=0}^K \exp(q \cdot k_i / \tau)}$$

MoCo

- Two encoder
 - Same arch
 - Different param
 - One update by SGD
 - Another update in momentum way

$$\theta_k \leftarrow m\theta_k + (1 - m)\theta_q.$$

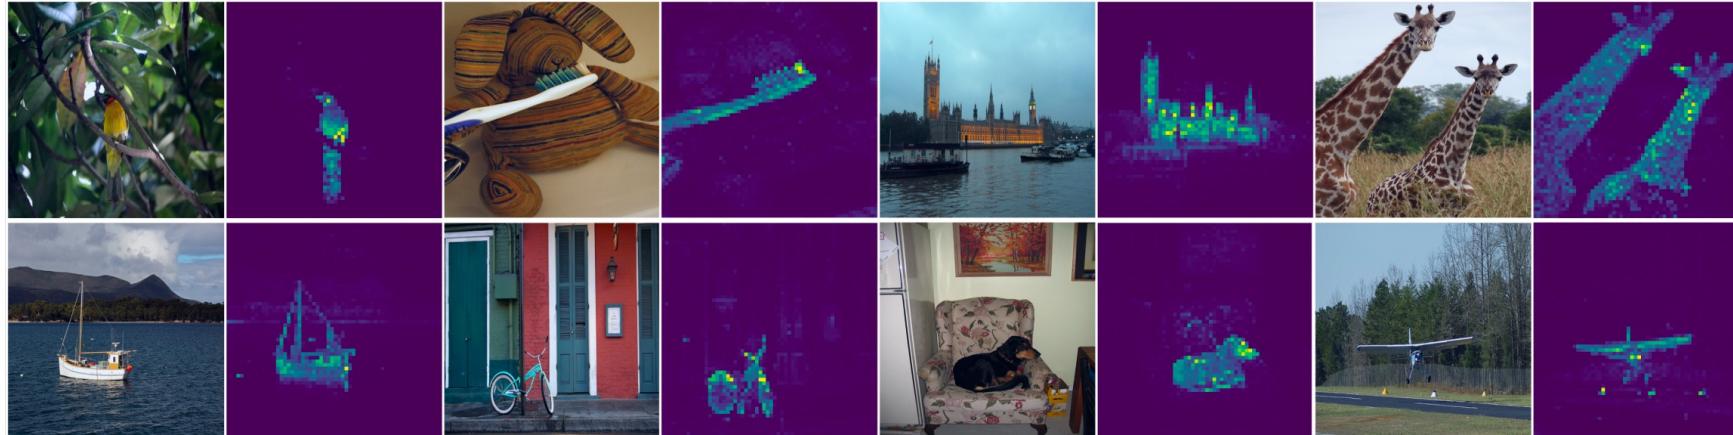

Figure 1: **Self-attention from a Vision Transformer with 8×8 patches trained with no supervision.** We look at the self-attention of the [CLS] token on the heads of the last layer. This token is not attached to any label nor supervision. These maps show that the model automatically learns class-specific features leading to unsupervised object segmentations.

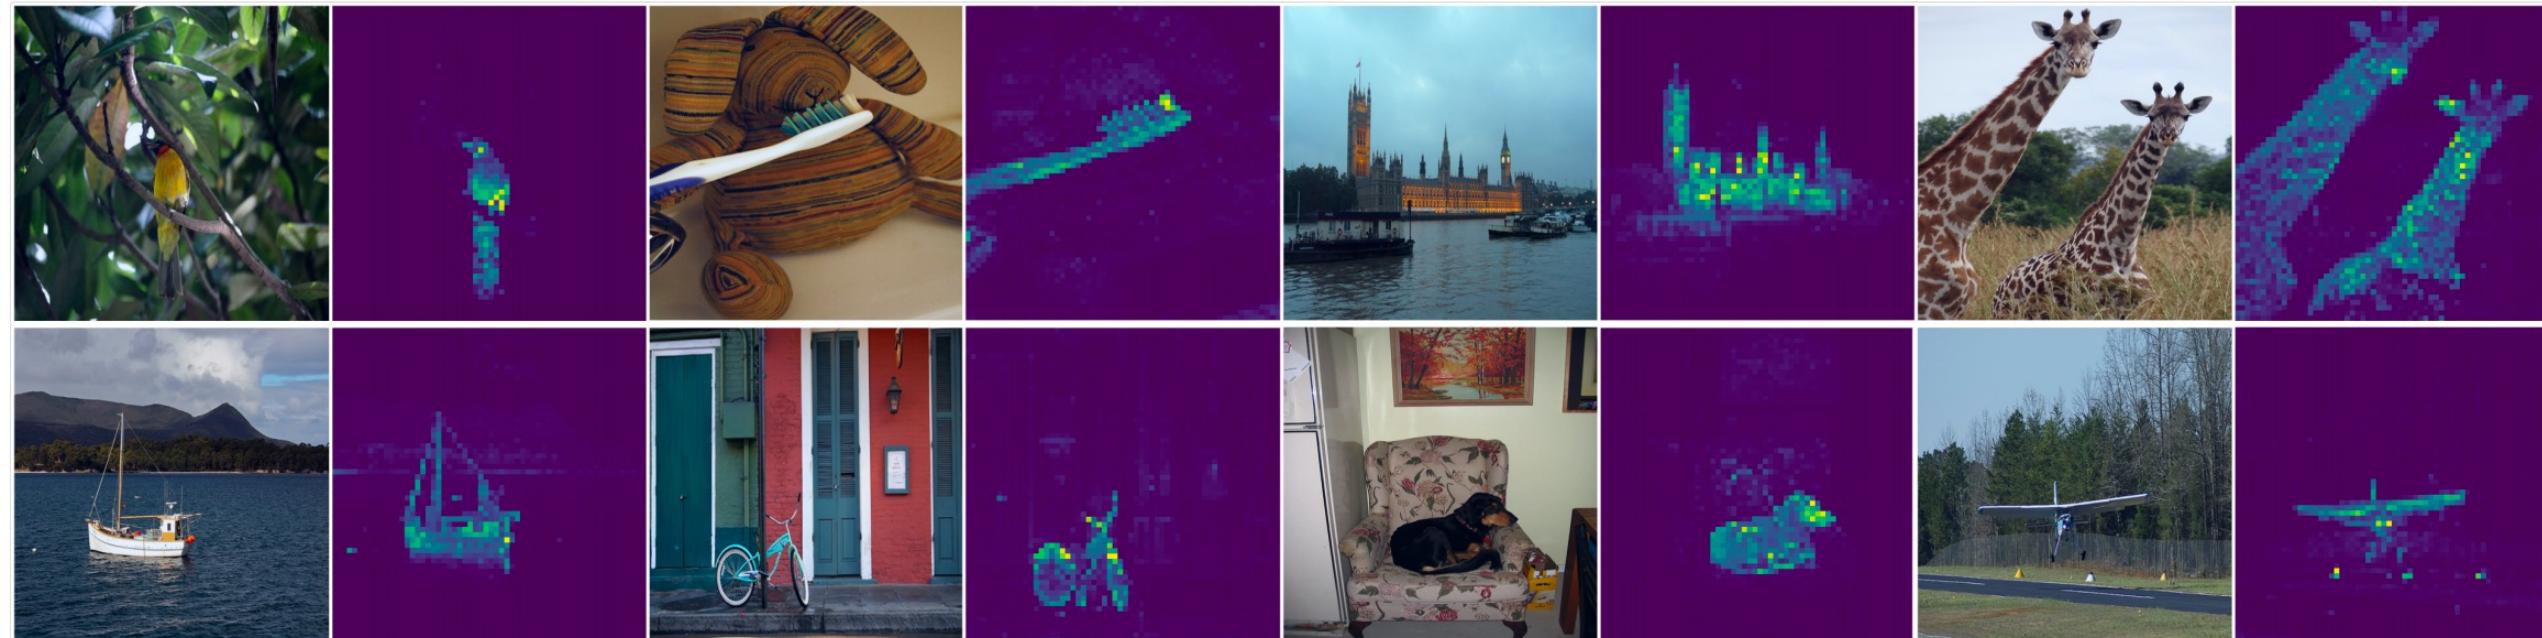

- Dino, self-distillation with **no** label
- Self-Supervise, knowledge distillation, transformer

Motivation

- Success of Transformers in NLP : use of self-supervised pretraining
 - Self-supervised training
 - Use the words in a sentence to create pretext tasks
 - Provide richer learning signal
 - Normal (supervised) training
 - Predicting single label per sentence
- Image level supervision
 - Single concept from a predefined set of a few thousand categories of objects

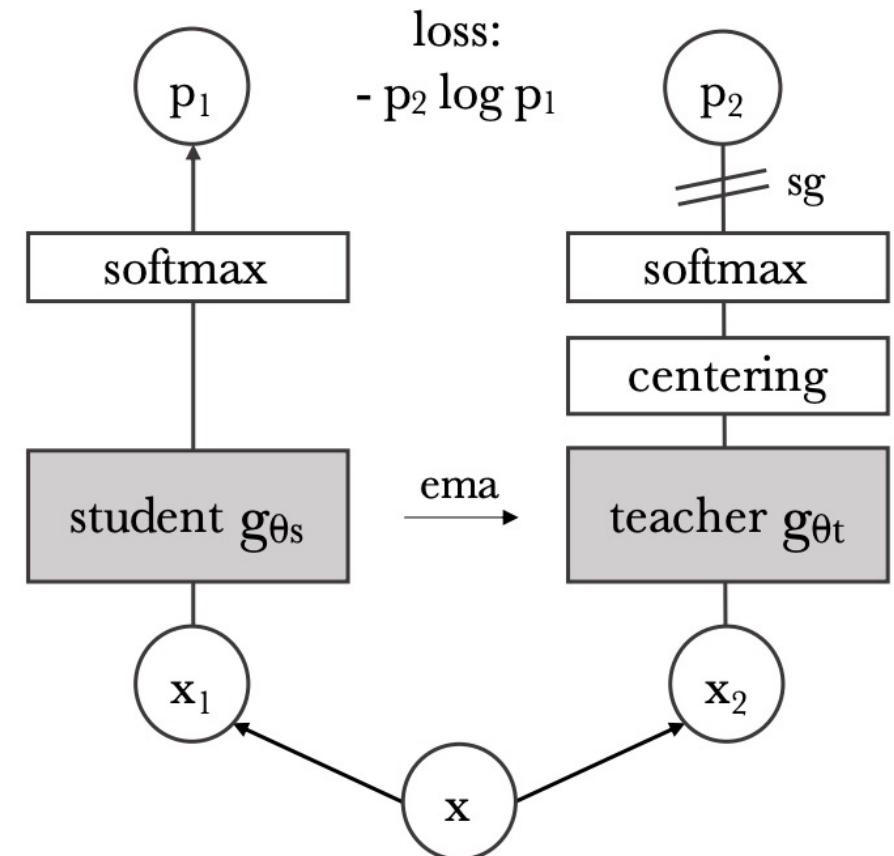

Motivation

- Self-supervised ViT feature
 - Contain scene layout and object boundaries
 - Performs well with k-NN method, without finetuning or linear classifier

Approach

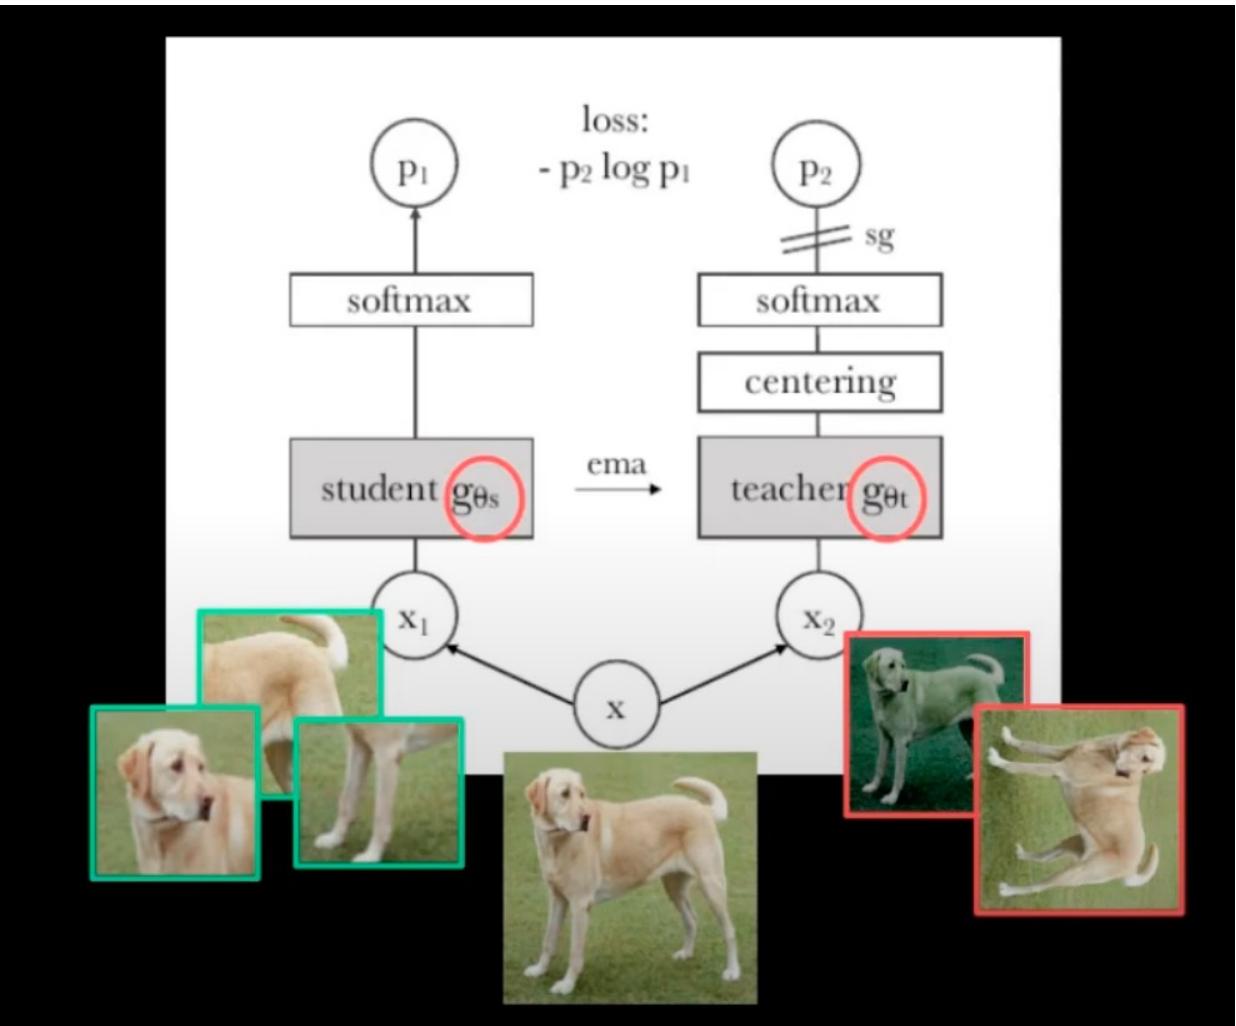

- Case of pair of views (x_1, x_2)
- x_1, x_2 , same image different transforms
- Networks, same arch different params
- Output K-dim vector
 - T: centering & sharpening, as GT
- Param update
 - S: Backprop
 - T: Stop gradient & exponential moving average

Input Multi-view

- V , set of different views
 - Two global views, $X_{g1} X_{g2}$
 - Several (8) local views, X_{li}
- Network
 - S: all views
 - T: global views

$$\min_{\theta_s} \sum_{x \in \{x_1^g, x_2^g\}} \sum_{\substack{x' \in V \\ x' \neq x}} H(P_t(x), P_s(x')).$$

Centering and Sharpening

- Centering teacher network, $g_t(x)$

$$g_t(x) \leftarrow g_t(x) + c.$$

$$c \leftarrow mc + (1 - m) \frac{1}{B} \sum_{i=1}^B g_{\theta_t}(x_i),$$

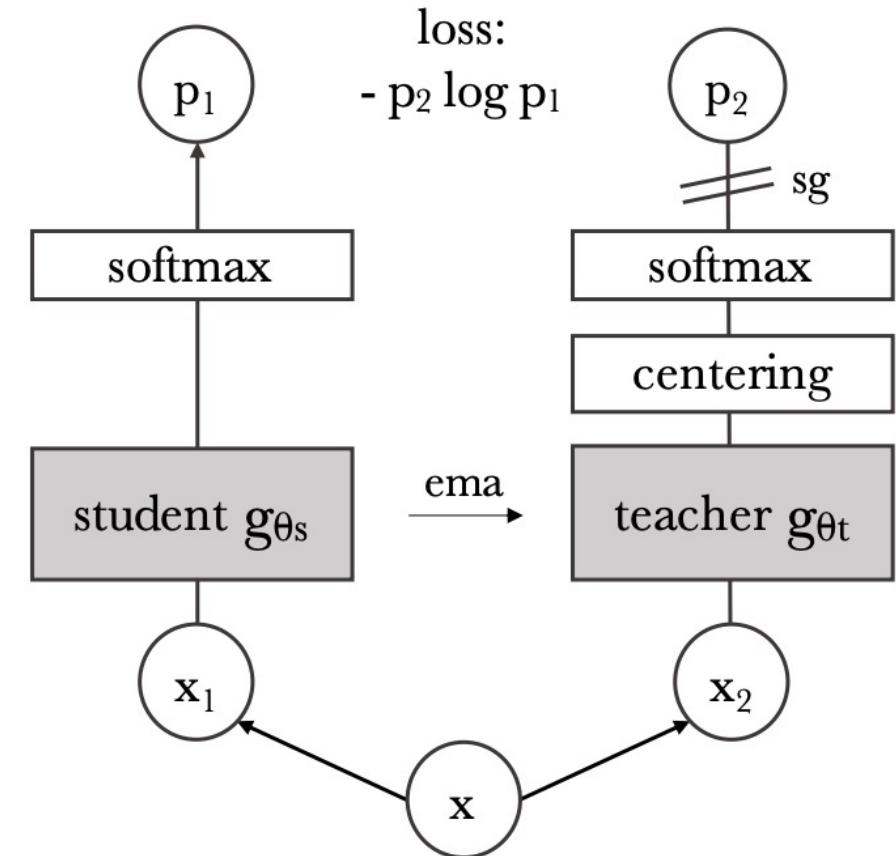

- Sharpening in softmax

$$P_s(x)^{(i)} = \frac{\exp(g_{\theta_s}(x)^{(i)}/\tau_s)}{\sum_{k=1}^K \exp(g_{\theta_s}(x)^{(k)}/\tau_s)},$$

```
a = [3, 2, 1]
```

```
softmax(a)
array([0.66524096, 0.24472847, 0.09003057])
```

```
softmax([i * 10 for i in a])
array([9.99954600e-01, 4.53978686e-05, 2.06106005e-09])
```

Centering and Sharpening

- Avoid collapse
- Centering
 - Encourage uniform output
- Sharpening
 - One dim dominating

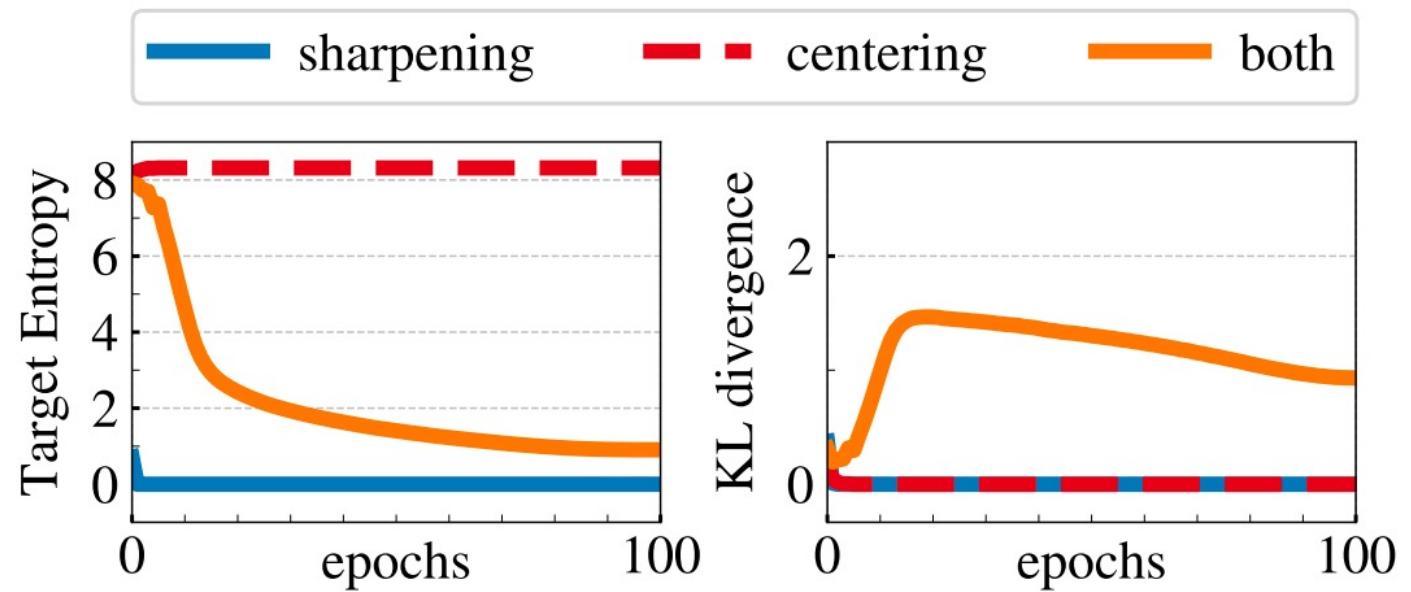

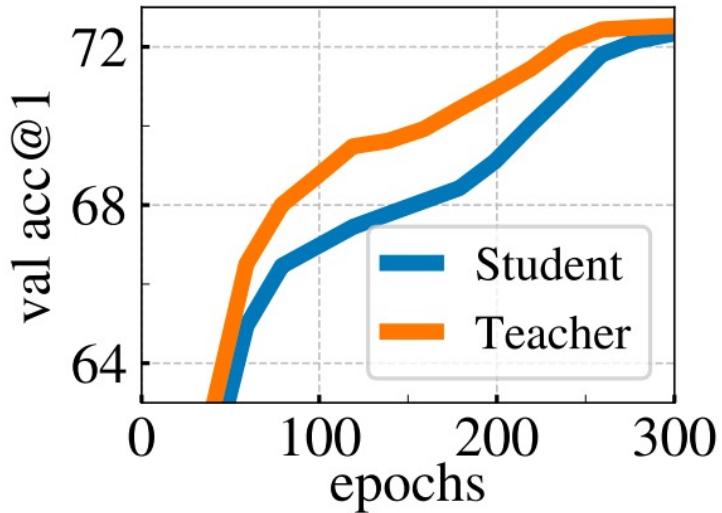

Figure 7: **Collapse study.** (left): evolution of the teacher's target entropy along training epochs; (right): evolution of KL divergence between teacher and student outputs.

Param Update

- Student
 - Adamw, backprop
- Teacher
 - $\theta_t \leftarrow \lambda\theta_t + (1 - \lambda)\theta_s$
 - λ 0.996 -> 1

Teacher	Top-1
Student copy	0.1
Previous iter	0.1
Previous epoch	66.6
Momentum	72.8

Figure 6: Top-1 accuracy on ImageNet validation with k -NN classifier. **(left)** Comparison between the performance of the momentum teacher and the student during training. **(right)** Comparison between different types of teacher network. The momentum encoder leads to the best performance but is not the only viable option.

Algorithm 1 DINO PyTorch pseudocode w/o multi-crop.

```
# gs, gt: student and teacher networks
# C: center (K)
# tps, tpt: student and teacher temperatures
# l, m: network and center momentum rates
gt.params = gs.params
for x in loader: # load a minibatch x with n samples
    x1, x2 = augment(x), augment(x) # random views

    s1, s2 = gs(x1), gs(x2) # student output n-by-K
    t1, t2 = gt(x1), gt(x2) # teacher output n-by-K

    loss = H(t1, s2)/2 + H(t2, s1)/2
    loss.backward() # back-propagate

    # student, teacher and center updates
    update(gs) # SGD
    gt.params = l*gt.params + (1-l)*gs.params
    C = m*C + (1-m)*cat([t1, t2]).mean(dim=0)

def H(t, s):
    t = t.detach() # stop gradient
    s = softmax(s / tps, dim=1)
    t = softmax((t - C) / tpt, dim=1) # center + sharpen
    return - (t * log(s)).sum(dim=1).mean()
```

Training Detail

- 1024 batch size
- 16 GPUs, v100
- 100 epoch

Implementation details. We pretrain the models on the ImageNet dataset [60] without labels. We train with the adamw optimizer [44] and a batch size of 1024, distributed over 16 GPUs when using ViT-S/16. The learning rate is linearly ramped up during the first 10 epochs to its base value determined with the following linear scaling rule [29]: $lr = 0.0005 * \text{batchsize}/256$. After this warmup, we decay the learning rate with a cosine schedule [43]. The weight decay also follows a cosine schedule from 0.04 to 0.4. The temperature τ_s is set to 0.1 while we use a linear warm-up for τ_t from 0.04 to 0.07 during the first 30 epochs. We follow the data augmentations of BYOL [30] (color jittering, Gaussian blur and solarization) and multi-crop [10] with a bicubic interpolation to adapt the position embeddings to the scales [19, 69]. The code and models to reproduce our results is publicly available.

Table 8: Time and memory requirements. We show total running time and peak memory per GPU (“mem.”) when running ViT-S/16 DINO models on two 8-GPU machines. We report top-1 ImageNet val acc with linear evaluation for several variants of multi-crop, each having a different level of compute requirement.

multi-crop	100 epochs		300 epochs		
	top-1	time	top-1	time	mem.
2×224^2	67.8	15.3h	72.5	45.9h	9.3G
$2 \times 224^2 + 2 \times 96^2$	71.5	17.0h	74.5	51.0h	10.5G
$2 \times 224^2 + 6 \times 96^2$	73.8	20.3h	75.9	60.9h	12.9G
$2 \times 224^2 + 10 \times 96^2$	74.6	24.2h	76.1	72.6h	15.4G

Other task

Table 3: **Image retrieval.** We compare the performance in retrieval of off-the-shelf features pretrained with supervision or with DINO on ImageNet and Google Landmarks v2 (GLDv2) dataset. We report mAP on revisited Oxford and Paris. Pretraining with DINO on a landmark dataset performs particularly well. For reference, we also report the best retrieval method with off-the-shelf features [57].

Pretrain	Arch.	Pretrain	\mathcal{R}_{Ox}		\mathcal{R}_{Par}	
			M	H	M	H
Sup. [57]	RN101+R-MAC	ImNet	49.8	18.5	74.0	52.1
